Immunogen Information

Background: This gene encodes a member of the interferon regulatory factor (IRF) family, a group of transcription factors with diverse roles, including virus-mediated activation of interferon, and modulation of cell growth, differentiation, apoptosis, and immune system activity. Members of the IRF family are characterized by a conserved N-terminal DNA-binding domain containing tryptophan (W) repeats. Mutations in this gene result in Immunodeficiency 65.

Recommended Dilution: WB, 1:500 - 1:2000

Synonyms: p48; IRF-9; ISGF3; ISGF3G; F9
