Immunogen Information

| Background | This gene encodes a protein that is similar to some members of the ERM (ezrin, radixin, moesin) family |
|-------------------------------|--|
| | of proteins that link cytoskeletal components with proteins in the cell membrane. The encoded protein |
| | is involved in regulation of contact-dependent inhibition of cell proliferation and functions in cell-cell |
| | adhesion and transmembrane signaling. The encoded protein has been shown to interact with cell- |
| | surface proteins, proteins involved in cytoskeletal dynamics, and proteins involved in regulating ion |
| | transport. Disruption of this protein's function has been implicated in tumorigenesis and metastasis. |
| | Mutations in this gene are associated with neurofibromatosis type II which is characterized by nervous |
| | system and skin tumors and ocular abnormalities. |
