| 50ug | PFDN1 is a heterohexameric chaperone protein which assists in the correct folding of |
| Reactivity: | other proteins. It binds specifically to cytosolic chaperonin and transfers target proteins. PFDN1 may function by selectively targeting nascent actin and tubulin chains pending |
| Human | their transfer to cytosolic chaperonin for final folding and/or assembly. It promotes folding in an environment in which there are many competing pathways for non native |
