Repressor of translation initiation that regulates EIF4E activity by preventing its
assembly into the eIF4F complex: hypophosphorylated form competes with

Reactivity: EIF4G1/EIF4G3 and strongly binds to EIF4E, leading to repress translation. In contrast,

Human hyperphosphorylated form dissociates from EIF4E, allowing interaction between

EIF4G1/EIF4G3 and EIF4E, leading to initiation of translation. Mediates the regulation of

protein translation by hormones, growth factors and other stimuli that signal through

the MAP kinase and mTORC1 pathways.
