## **Protein Information**

Background:This gene encodes a member of a family of small membrane proteins that share a<br/>35-amino acid signature sequence domain, beginning with the sequence PFXYD and<br/>containing 7 invariant and 6 highly conserved amino acids. The approved human<br/>gene nomenclature for the family is FXYD-domain containing ion transport regulator.<br/>FXYD4, originally named CHIF for channel-inducing factor, has been shown to<br/>modulate the properties of the Na,K-ATPase, as has FXYD2, also known as the gamma<br/>subunit of the Na,K-ATPase, and FXYD7. Transmembrane topology has been<br/>established for FXYD4 and two family members (FXYD1 and FXYD2), with the N-<br/>terminus extracellular and the C-terminus on the cytoplasmic side of the membrane.<br/>Alternatively spliced transcript variants encoding the same protein have been<br/>found.[provided by RefSeq, May 2010]Synonyms:CHIF

**Protein Description**: Human FXYD4-Strep full length protein-synthetic nanodisc

Formulation: Lyophilized from nanodisc solubilization buffer (20 mM Tris-HCl, 150 mM NaCl, pH 8.0). Normally 5% – 8% trehalose is added as protectants before lyophilization. Please see Certificate of Analysis for specific instructions. Do not use solvents with a pH below 6.5 or those containing high concentrations of divalent metal ions (greater than 5 mM) in subsequent experiments.

Protein Pathways:

Protein Families:	Ion Channels: Other.
Usage:	Research use only
Storage & Shipping:	Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not
	intended for use within a month, aliquot and store at -80°C (Avoid repeated freezing
	and thawing). Lyophilized proteins are shipped at ambient temperature.
